Abstract

This artifact is a companion to the paper “Blame for Null”, where we formalize multiple calculi to reason about the interoperability between languages where nullability is explicit and those where nullability is implicit. Our main result is a theorem that states that nullability errors can always be blamed on terms with less-precise typing; that is, terms typed as implicitly nullable. We summarize our result with the slogan explicitly nullable programs can’t be blamed. The artifact consists of a mechanized Coq proof of the results presented in the paper.

1 Scope

The paper’s contributions are reproduced below (the wording is adapted from the paper):

- A core calculus, \( \lambda \text{null} \), that formalizes the essence of type systems with implicit and explicit nullability, like those of Kotlin and Scala.
- A higher-level calculus, stratified \( \lambda \text{null} \), that models the interoperability between languages with implicit nullability and languages with explicit nullability.
- A metatheory for \( \lambda \text{null} \), consisting of the standard progress and preservation lemmas, as well as blame theorems that characterize how nullability errors can occur.

Blame for Null (Artifact)

A metatheory for stratified lambda null with two main components. First, a desugaring semantics for stratified lambda null. Second, our main result, which states that nullability errors can always be blamed on terms with less-precise typing; that is, terms typed as implicitly nullable. In the style of earlier work on blame, we summarize our result with the slogan explicitly nullable programs can't be blamed.

The artifact substantiates the contributions by providing a mechanized Coq proof of all results presented in the paper.

Content

The artifact is packaged as a Virtual Box VM (an .ova file) containing:
- A detailed guide listing the correspondence between definitions and lemmas in the paper and those in the mechanization.
- A mechanized Coq proof that includes all results from the paper.

Getting the artifact

The artifact endorsed by the Artifact Evaluation Committee is available free of charge on the Dagstuhl Research Online Publication Server (DROPS). In addition, the artifact is also available at: https://github.com/abeln/null-calculus.

Tested platforms

We have tested the VM with VirtualBox Version 6.1.6 r137129 (Qt5.6.3). The OS installed in the VM is Ubuntu 18.04.

License

The artifact is available under an MIT license.
