Abstract

We present Linearizability Hoare Logic (LHL), the first *mechanized*, *sound*, and *complete* program logic for atomic, set, and interval linearizability. We achieve this by showing soundness and completeness of LHL w.r.t. a more general criterion, *compositional linearizability*, which subsumes all three criteria. We showcase the expressivity of LHL by verifying an exchanger with a set linearizable specification, the elimination-backoff stack built above the exchanger, a lock with an atomic linearized specification, and a write-snapshot object with an interval linearizable specification.

Together with LHL we formalize a modular verification framework for concurrent components based on the theory of compositional linearizability. This allows us to specify components at a high level of abstraction and granularity, and then assemble them into large systems that are correct by construction. As a showcase, we verify the elimination-backoff stack modularly by verifying each of its sub-components against their linearized specifications and then linking them together.

2012 ACM Subject Classification Theory of computation → Program verification; Computing methodologies → Concurrent computing methodologies; Theory of computation → Programming logic

5:2 A Complete Program Logic for Compositional Linearizability (Artifact)

1 Scope

All theorems and examples in the paper are mechanized in the artifact. Key elements are the compositionality of our definition of linearizability (see `Core/LinFacts.v`), the soundness and completeness of our logic (see `Core/LogicFacts.v`), and all examples (see the `Examples` folder).

2 Content

The `Examples` folder contains mechanizations of all examples in the paper. They depend on the `Core` folder, which contains the mechanization of the program logic and linearizability. The following describes its most important files.

- `RefinesFacts.v`: Contains refinement theorems about vertical composition, necessary to prove observational refinement.
- `TensorFacts.v`: Contains refinement theorems about horizontal composition along with the interaction of horizontal composition with vertical composition, necessary to prove locality.
- `LinFacts.v`: Contains the proofs of observational refinement and locality, showing our definition of linearizability is indeed compositional.
- `Logic.v`: Contains the definition of the program logic.
- `LogicFacts.v`: Contains the proofs of soundness and completeness of our program logic.
- `ProgramRules.v`: Contains essential derived rules of the program logic, necessary for practical proofs using it.

3 Getting the artifact

The artifact endorsed by the Artifact Evaluation Committee is available free of charge on the Dagstuhl Research Online Publication Server (DROPS). In addition, the artifact is also available at: <https://github.com/ehatti/LHL>.

4 Tested platforms

Building the artifact has been tested on Windows, Mac, and Linux, and requires minimal computational resources (building takes approximately 2 minutes on a low-end Macbook Pro). A docker image and build script are provided to automate the build process, instructions may be found in the artifact's `README.md`.

5 License

The artifact is available under the BSD 3-Clause license.
